Europa-Universität Flensburg

Worksheet Group 1

Instructions: You have 25 minutes to read your assigned sources and prepare answers to the guiding questions below. You will then join an "expert group" with one member from each of the other topics and have about 20 minutes to teach them what you've learned – and learn from them in turn. Prepare to explain your topic in front of the other students; bullet points are fine, but aim to explain it in your own words.

Sources

European Commission — Development of EU ETS 2005-2020 (climate.ec.europa.eu)
International Carbon Action Partnership (icapcarbonaction.com/) — ETS factsheets

Guiding Questions

- What was the core design of each phase, and what was the one biggest change made from one phase to the next? (Try to capture this in one sentence per phase.)
- What went wrong in Phase I, and why? What effect did this have on the carbon price?
- What went wrong in Phase II, and was it the same problem as Phase I or a different one?
- What structural reforms did Phase III introduce (think: who sets the cap, how allowances are allocated)? Did these reforms fully solve the low-price problem — why or why not?
- Prepare one number you find most striking (a price, a percentage, a date) to share with your expert group.

Worksheet Group 2

Instructions: You have 25 minutes to read your assigned sources and prepare answers to the guiding questions below. You will then join an "expert group" with one member from each of the other topics and have about 20 minutes to teach them what you've learned – and learn from them in turn. Prepare to explain your topic in front of the other students; bullet points are fine, but aim to explain it in your own words.

Sources

European Commission — Market Stability Reserve page (climate.ec.europa.eu)
International Carbon Action Partnerships — MSR factsheet (icapcarbonaction.com)

Guiding Questions

- What specific problem was the MSR designed to solve? (Hint: connect this back to what Group I will tell you about Phase III's leftover surplus.)
- In your own words, how does the MSR mechanism actually work? Try to explain it as a simple rule: "If X happens, then Y happens."
- What changed in the 2018 reform, and why did this matter more than the original 2015 design?
- What happened to carbon prices after the MSR became operational (2019) and after the reform took effect? Can you find or estimate a price before/after comparison?
- Discussion angle: Is the MSR a "market" mechanism, or is it actually a form of centralized market management? Form a quick opinion — you'll be asked to defend it.

Worksheet Group 3

Instructions: You have 25 minutes to read your assigned sources and prepare answers to the guiding questions below. You will then join an "expert group" with one member from each of the other topics and have about 20 minutes to teach them what you've learned – and learn from them in turn. Prepare to explain your topic in front of the other students; bullet points are fine, but aim to explain it in your own words.

Sources

European Commission — official CBAM page (taxation-customs.ec.europa.eu or climate.ec.europa.eu)
Carbon Market Watch — CBAM analysis (carbonmarketwatch.org)

Guiding Questions

- What problem is CBAM trying to solve? (Define "carbon leakage" in your own words — why might a company move production outside the EU?)
- How does CBAM actually work in practice? Who pays, and at what point (e.g., import, sale, production)?
- Which sectors/products are currently covered, and what is the implementation timeline (when does reporting start, when does full payment obligation start)?
- What is the relationship between CBAM and free allocation — why does one phase in as the other phases out?
- What is the main criticism of CBAM, particularly from developing countries or NGOs? Prepare to explain both the EU's justification and the critique — you'll be the "devil's advocate" voice in your expert group.

Worksheet Group 4

Instructions: You have 25 minutes to read your assigned sources and prepare answers to the guiding questions below. You will then join an "expert group" with one member from each of the other topics and have about 20 minutes to teach them what you've learned – and learn from them in turn. Prepare to explain your topic in front of the other students; bullet points are fine, but aim to explain it in your own words.

Sources

European Commission — official ETS2 page (climate.ec.europa.eu)
International Carbon Action Partnership — ETS2 factsheet (icapcarbonaction.com)

Guiding Questions

- What sectors and emissions does ETS2 cover that the original ETS (now sometimes called "ETS1") does not?
- Who is actually regulated under ETS2 — is it households and drivers directly, or someone further up the supply chain? Why was it designed this way?
- How does ETS2's allocation method differ from ETS1 (think: free allocation vs. auctioning)?
- When does ETS2 start, and what is the Social Climate Fund — what problem is it meant to address?
- Discussion angle: ETS2 has been called politically risky because it could raise heating and fuel costs for ordinary households. Why might a government choose to introduce it anyway? Prepare one argument for and one concern against.
